

# RFID Technology

As part of US Med-Equip's commitment to smart solutions to help our partners manage their moveable medical equipment needs, we have invested in passive RFID technology. US Med-Equip is changing the way hospitals manage their equipment by tagging our entire rental fleet with passive RFID tags. Hospitals now have a tool to quickly and efficiently locate equipment.

## How Does it Work?

RFID readers can locate tagged equipment up to 25 feet away.

The RFID reader emits RADIO WAVES that read the RFID tag and relay equipment information to the hand-held scanner.

Patients experience minimal disruptions as the waves bounce under closed doors, around corners and through walls.

The RFID scanner and tags do not interfere with other medical equipment and systems.

## How Does it Benefit My Hospital?

Quickly locate equipment that may be potentially missing, recalled or in need of preventative maintenance.

Increase utilization of hospital equipment leading to reduced rental needs, resulting in potential cost savings.

Locate equipment which may be "hidden" from sight, such as in a drawer, closet, under a bed, locker, etc.

Fast identification of "wanted" equipment.

Helps with PM compliance.

Need a complete asset management solution for capital and rental equipment? Take a look at our STAR Trax® Program.

*NOTE: RFID scanning assistance is available at customer locations within our rental service area.*
